

## **Environmental Declaration**

### **Status and Development**

R&D efforts are running since 1990's to replace labelled oils (HAOs) with materials environmentally friendly. MES and TDAE oils could be used on this purpose. As well known the substitution is not easy and requires product/process adjustments.

Passenger winter tyres were the first to be modified in the tread. Production of winter tyres with low levels of HAO started in 1998.

Currently the following product lines do not contain HAOs in the tread and therefore do not release them during normal use:

Pirelli Winter Lines:

Winter 160/190 SnowControl

Winter 190/210 SnowSport

Winter 190/210 SottoZero

Winter Carving

Winter 190 Studdable +

Winter IceStorm

Chrono Winter

The goal is to have all Pirelli tyres free from HAOs by 2009 according to European Directive 2005/69/EC.

N.B some dimensions could contain HA-oils above the level established by the a.m. directive. Please contact us for further information.
